TEST REPORT- Wet Pendulum Slip Resistance Classification (New Zealand Standard)

Report Prepared for:	Forte Flooring 3 Keith Place Pukekohe Auckland 2120	Page #: Contract #:	1 of 1 8006
Test Date:	19-03-2020		
Test Site:	Independent Slip Testing Services- Slip Resistance Laboratory (Lota QLD HQ)		
Testing Technician:	A.Burch		
Testing Instrument:	Pendulum Skid Tester with Slider 96 (4S) rubber slider		
	Testing Instrument Serial #: SK1105 (W1)		

TESTING SPECIMEN DESCRIPTION, SIZE, COLOUR, TY	PF. & COATING (if applicable)

1 X Artiste, Brown Timber, Sample Size 30x26cm

2. 1 X Artiste, Brown Timber, Sample Size 30x26cm

3. 1 X Artiste, Brown Timber, Sample Size 30x26cm

(3 X Samples tested in 5 X locations)

Surface Condition:	Fine Textured	Cleaning:	Tested as received
Fixed/ Unfixed:	Unfixed	Rz Mean:	n/a
Environmental Conditions:	Air conditioning	Air Temp:	24 Deg.C
Direction of Test:	As indicated on underside of sample	Slope:	n/a

INTERPRETATION OF THE WET PENDULUM RESULTS			
Classification	Pendulum mean BPN Slider 96 (4S) rubber	Notional contribution of the floor surface to the risk of slipping when wet	
V	>54	Very Low	
W	45-54	Low	
х	35-44	Moderate	
Y	25-34	High	
Z	<25	Very High	

### TEST RESULTS

Specimen #1 Result: 42 bpn 29 bpn #2 Result: #3 Result: 31 bpn #4 Result: 33 bpn #5 Result: 39 bpn

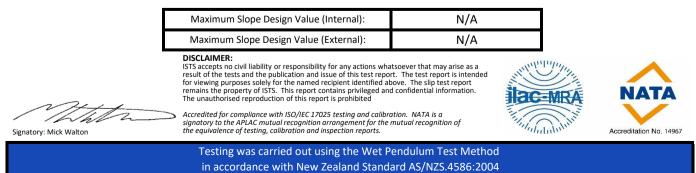

Slider condition (P400): 87 BPN Temperature adjustment: n/a

### CLASSIFICATION

CLASSIFICATION	PENDULUM MEAN BPN Slider 96 (4S) rubber	NOTIONAL CONTRIBUTION OF THE FLOOR SURFACE TO THE RISK OF SLIPPING WHEN WET
x	35 BPN	Moderate

The mean results of the five specimens is reported (rounded to nearest whole number)

^ When an individual result both below the result classification and below the mean result minus 20% shall be considered of lower classification

TREATIN	<b>1ENT OP</b>	TIONS

or surfaces that achieve a BPN result below the recommendations the following are options are available to

### increase slip resistance and Reduce Your Risk!

While ISTS is solely an audit service, following is a short list of common types of treatments we see our clients using to improve the slip resistance of various pedestrian surface materials...

- lures Detergent residues can build up over time with heavy detergent use. For tiled surfaces. Can vary in performance with different tile types.
- **blasting** To obtain a textured finish to tiles and other hard surfaces (may require sealing).

More extreme treatment to wet sand blasting (may require sealing).

Ensure a consistent texture is achieved.

Replacement surface may be the most cost effective option in some locations

internet search for 'flooring treatments' will identify surface treatment professionals in your local area. ISTS recommends sourcing a number of detailed proposals when considering treatments, outlining expected slip resistance improvements, visual changes, clean ability and life expectancy.

### **ADDITIONAL NOTES & REFERENCES**

'RatingsThe Ramp 'R' ratings are obtained using the ramp test. An 'R' rating can not be achieved for in-situ testing.There is no correlation between 'R' ratings and wet pendulum test results.

### AS/NZS.4586:2004

INTERPRETATION OF THE DRY FLOOR FRICTION RESULTS			
CLASSIFICATION	FLOOR FRICTION TESTER	NOTIONAL CONTRIBUTION OF THE FLOOR	
MEAN VALUE SURFACE TO THE RISK OF SLIPPING WHEN DR			
F	≥40	Moderate to Very Low	
G	< 40	High to Very High	

### **TEST RESULTS**

Specimen	Test Run #1 result:	0.57
	Test Run #2 result:	0.52

### **CLASSIFICATION**

CLASSIFICATION	# Mean COF Rounded to 0.05	NOTIONAL CONTRIBUTION OF THE FLOOR SURFACE TO THE RISK OF SLIPPING WHEN DRY
F	0.55	Moderate to Very Low

### **Results Comments:**

- 1. \* Indicates an individual test run registered below 0.40
- 2. \*\* Indicates a test sector of an individual test run is < 0.35; resulting in a compulsory "G" classification
- 3. # The mean result of Test 1 & 2 is rounded to nearest 0.05
- nb. Test specimens are disposed after 1 month if not collected by client

#### DISCLAIMER:

Signatory: Mick Walton

DISCLAIMER: ISTS accepts no civil liability or responsibility for any actions whatsoever that may arise as a result of the tests and the publication and issue of this test report. The test report is intended for viewing purposes solely for the named recipient identified above. The slip test report remains the property of ISTS. This report contains privileged and confidential information. The unauthorised reproduction of this report is prohibited.

Accredited for compliance with ISO/IEC 17025 testing and calibration. NATA is a signatory to the APLAC mutual recognition arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

Testing was carried out using the Dry Friction Test Method in accordance with New Zealand Standard AS/NZS.4586:2004

### DRY TEST RESULTS INTERPRETATION GUIDE (NEW ZEALAND STANDARD)

### INTERPRETING DRY TEST RESULTS

How to interpret your dry test report...

Dry test results offer two possible outcomes- classification 'F' or classification 'G'.

The classification 'G' reflects a less slip resistant surface, while the recommended 'F' classification reflects a greater slip resistant surface.

Step 1. Note the test location described in the left side column of your report, and the corresponding test result classification achieved (listed in the far right side column).

Step 2. If the test result classification listed is 'F', the test surface is meeting the relevant recommendations.

### FREQUENTLY ASKED QUESTIONS

### 1. The mean test average is ≥0.40, however the result is 'G' classification ?

- A. The mean of the test results should be equal to or greater than 0.40 and each individual result should be equal to or greater than 0.35. If either of this criteria is not met, the lot shall be considered to be 'G' classification'.
- 2. What does \* and \*\* indicate?
  - A. \* Indicates part of a test run registered under 0.40.
    - \*\* Indicates part of a test run registered less than 0.35 resulting in a compulsory 'G' classification'.
- 3. Why are test results rounded to the nearest 0.05?
  - A. As described in the relevant standards, the mean result of Test 1 & Test 2 is rounded to nearest 0.05.
- 4. What is the classification requirement for particular locations as stated in publication SS 485:2011 Annex B?
  - A. The New Zealand testing standard indicates floors should have a dry floor friction classification of F unless normal usage dictates that the floor should have a low dry coefficient of friction, eg. dance floors.
- 5. How about dry testing for external areas?
  - A. Dry slip resistance measurement does not apply to external surfaces. If a pedestrian surface is likely to become wet and remain wet for any significant period of time, wet pendulum testing is the appropriate test method.
- 6. How do I improve the slip resistance of a surface currently achieving 'G' classification?
  - A. Many treatments and procedures are available to improve slip resistance. Treatment options will vary depending on the type of surface and whether a sealed or unsealed finish is required. Described on the right are a list of options to improve slip resistance and Reduce Your Risk!

Classification of pedestrian surface materials according to the dry floor friction test.				
Classification (Notional contribution to risk)	Test Result Mean Value			
(AS/NZS.4663:2004)	(COF)			
F (Moderate to Very Low)	≥ 0.40			
G (High to Very High)	< 0.40			

\*TARIF 3

### TREATMENT OPTIONS

For test results that achieve a result below recommendations, the following treatment options are available to increase slip resistance and Reduce Your Risk!

> While ISTS is solely an audit service, following is a short list of common types of treatments we see our clients using to improve the slip resistance of various pedestrian surface materials...

Cleaning procedures	Minimising detergent residue build up or other contaminants	
Acid etching	Increasing surface texture.	
Coatings and sealers	Surface coatings and penetrative types.	
Surface texture	Coatings, etchants, sandblasting, shot blasting, etc.	
Surface replacement	May be the most cost effective option in some instances.	

An internet search for 'flooring treatments' will identify surface treatment professionals in your local area. ISTS recommends sourcing a number of detailed proposals when considering treatments, outlining expected slip resistance improvements, visual changes, clean ability and life expectancy.

### ...Considering pedestrian surface enhancements, or developing your property?

If you are selecting, purchasing or installing pedestrian surface materials, an independent, accredited classification is a useful tool providing confidence to all stakeholders the product will perform as specified.

Independent Slip Testing Services is the global leader in accredited slip resistance measurement and classification of pedestrian surface materials prior to installation.

..see the ISTS 'GPC Results Interpretation Booklet' for guidance on pedestrian surface product selection.
